1. Problem Statement

John is building a system to store and manage integers using a binary search tree (BST). He needs to add a feature that allows users to search for a specific integer key in the BST using recursion.

Implement functions to create the BST and perform a recursive search for an integer.

Input Format

The first line of input consists of an integer representing, the number of nodes.

The second line consists of integers representing, the values of nodes, separated by space.

The third line consists of an integer representing, the key to be searched.

Output Format

The output prints whether the given key is present in the binary search tree or not.

Refer to the sample output for the exact format.

Sample Test Case

Input: 7
10 5 15 3 7 12 20
12
Output: The key 12 is found in the binary search tree

Answer

```c
// You are using GCC
#include <stdio.h>
#include <stdlib.h>

struct Node {
    int data;
    struct Node* left;
    struct Node* right;
};

struct Node* createNode(int value) {
    struct Node* newNode = (struct Node*) malloc(sizeof(struct Node));
    newNode->data = value;
    newNode->left = newNode->right = NULL;
    return newNode;
}

struct Node* insert(struct Node* root, int value) {
    if (root == NULL)
        return createNode(value);

    if (value < root->data)
        root->left = insert(root->left, value);
    else if (value > root->data)
        root->right = insert(root->right, value);
```

```c
        return root;
    }

    int search(struct Node* root, int key) {
        if (root == NULL)
            return 0;
        if (root->data == key)
            return 1;
        else if (key < root->data)
            return search(root->left, key);
        else
            return search(root->right, key);
    }

    int main() {
        int n, key;

        scanf("%d", &n);

        int value;
        struct Node* root = NULL;

        for (int i = 0; i < n; i++) {
            scanf("%d", &value);
            root = insert(root, value);
        }

        scanf("%d", &key);

        if (search(root, key))
            printf("The key %d is found in the binary search tree\n", key);
        else
            printf("The key %d is not found in the binary search tree\n", key);

        return 0;
    }
```

Status : Correct   *Marks : 10/10*

2. Problem Statement

You are given a series of magic levels (integers) and need to construct a Binary Search Tree (BST) from them. After constructing the BST, your task is to perform a range search, which involves finding and printing all the magic levels within a specified range [L, R].

Input Format

The first line of input consists of an integer N, the number of magic levels to insert into the BST.

The second line consists of N space-separated integers, representing the magic levels to insert.

The third line consists of two integers, L and R, which define the range for the search.

Output Format

The output prints all the magic levels within the range [L, R] in ascending order, separated by spaces.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 5
10 5 15 3 7
2 20
Output: 3 5 7 10 15

Answer

```c
// You are using GCC
#include <stdio.h>
#include <stdlib.h>

struct Node {
    int data;
    struct Node* left;
    struct Node* right;
};
```

```c
struct Node* createNode(int value) {
    struct Node* newNode = (struct Node*)malloc(sizeof(struct Node));
    newNode->data = value;
    newNode->left = newNode->right = NULL;
    return newNode;
}

struct Node* insert(struct Node* root, int value) {
    if (root == NULL)
        return createNode(value);

    if (value < root->data)
        root->left = insert(root->left, value);
    else if (value > root->data)
        root->right = insert(root->right, value);

    return root;
}

void rangeSearch(struct Node* root, int L, int R) {
    if (root == NULL)
        return;

    if (root->data > L)
        rangeSearch(root->left, L, R);

    if (root->data >= L && root->data <= R)
        printf("%d ", root->data);

    if (root->data < R)
        rangeSearch(root->right, L, R);
}

int main() {
    int N;
    scanf("%d", &N);

    struct Node* root = NULL;
    int value;

    for (int i = 0; i < N; i++) {
```

```
    scanf("%d", &value);
    root = insert(root, value);
}

int L, R;
scanf("%d %d", &L, &R);

rangeSearch(root, L, R);
printf("\n");

return 0;
}
```

Status : Correct   *Marks : 10/10*

3. Problem Statement

Arun is working on a Binary Search Tree (BST) data structure. His goal is to implement a program that reads a series of integers and inserts them into a BST. Once the integers are inserted, he needs to add a given integer value to each node in the tree and find the maximum value in the BST.

Your task is to help Arun implement this program.

Input Format

The first line of input consists of an integer N, representing the number of elements to be inserted into the BST.

The second line consists of N space-separated integers, each representing an element to be inserted into the BST.

The third line consists of an integer add, representing the value to be added to each node in the BST.

Output Format

The output prints the maximum value in the BST after adding the add value.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 5
10 5 15 20 25
5

Output: 30

Answer

```c
// You are using GCC
#include <stdio.h>
#include <stdlib.h>

struct Node {
    int data;
    struct Node* left;
    struct Node* right;
};

struct Node* createNode(int value) {
    struct Node* newNode = (struct Node*) malloc(sizeof(struct Node));
    newNode->data = value;
    newNode->left = newNode->right = NULL;
    return newNode;
}

struct Node* insert(struct Node* root, int value) {
    if (root == NULL)
        return createNode(value);

    if (value < root->data)
        root->left = insert(root->left, value);
    else if (value > root->data)
        root->right = insert(root->right, value);

    return root;
}

void addValueToAllNodes(struct Node* root, int add) {
    if (root == NULL)
        return;
```

```c
        root->data += add;
        addValueToAllNodes(root->left, add);
        addValueToAllNodes(root->right, add);
    }

    int findMax(struct Node* root) {
        if (root == NULL)
            return -1;

        while (root->right != NULL)
            root = root->right;

        return root->data;
    }

    int main() {
        int N, value, add;
        scanf("%d", &N);

        struct Node* root = NULL;

        for (int i = 0; i < N; i++) {
            scanf("%d", &value);
            root = insert(root, value);
        }

        scanf("%d", &add);

        addValueToAllNodes(root, add);

        int maxVal = findMax(root);
        printf("%d\n", maxVal);

        return 0;
    }
```
